Job Market Paper

The Burden of Carbon Taxes: Borne by Workers or Owners?

Abstract: This paper measures the incidence of a carbon tax on workers and firm owners. To do so, I estimate the changes in total payroll and profits after taxes of the same firms, relative to the total burden, measured as the fall in value added. I study the manufacturing sector under British Columbia's 2008 carbon tax, using balance-sheet data linked to information on fossil fuel expenditure. I use a triple-difference design that compares fossil-fuel-intensive industries to less fuel-intensive industries within British Columbia, and the same difference in other provinces, before and after the reform. At the average fossil-fuel-intensive firm, revenue falls, and lower spending on fossil fuels and other inputs offsets most of this decline. The remaining burden falls mainly on workers. Total payroll falls while profits after taxes do not change, and the difference between the two is statistically significant. Among single-province firms, the burden on workers is larger and statistically significant in smaller and more capital-intensive firms, which have fewer ways to adjust. Owners, whose profit margins were already thin before the reform, bear little of the burden.
